

Green roofs Learning, Training and Teaching

Thanks to ANCV's activity, we conducted an extremely successful training program for students in Portugal. Thirty participants were selected by university partners (10 each from SUT, UDJG, and KVK) and, after completing the Green Roofs course, went on internships. We would like to thank the participating companies: LIPOR, CMIA, FIBRAN, and IMPERALUM.

The students were divided into teams. They implemented green roof projects, planned, located, and selected the appropriate system in line with sustainable development goals.

The project implementation was supervised by engineers from the host companies. Detailed analyses of the potential environmental impact of the technology used were conducted, particularly in terms of CO2 offset and energy savings. The project concluded with a presentation. We presented our idea and the potential benefits of integrating green infrastructure into the facility.

Pilot activities

We successfully tested our Green Roofs course. Each partner conducted training with at least 20 participants. Participant interest and feedback exceeded our expectations.

Guidelines

We are finalizing the guidelines for teachers and other stakeholders. They will incorporate our experiences and observations from the the project.

Conferences

We invite you to participate in conferences summarizing the project's implementation. They will be held in all partner countries.
